Introduction

You can use Data to store information like a card index system, with a separate entry for each “card”.

When you first use Data, the “labels” (e.g. Subject, Notes, and so on) are designed so that you can start a “knowledgebase” of information straight away. You can use the standard labels to keep track of items of information about different subjects in one file or in different files. For example, you may want to keep a database for notes about software products, another one for interesting Web sites, and another for restaurants you want to visit.

You can also create databases for other types of information by changing the labels to match the information you wish to enter. See ‘*Customising the database*’ later.

Displaying on-line help

To display on-line help, select the [Help on Data](#) option from the [Tools](#) menu.

Adding an entry

You can add entries in any order. You can sort them into alphabetical order later; see ‘*Sorting entries*’ later. To add an entry:

1. Tap the [New entry](#) button on the Toolbar or select the command from the [Edit](#) menu.
2. Type the information in the appropriate boxes. If you don't have any information for one of the labels, you can leave the box blank.
 - Tap on a label or use the Tab key to move between the boxes. Use the scroll bar to move to boxes that are not currently displayed.
3. While you're typing, you can:
 - Use the arrow keys to move the cursor around the text.
 - Press Enter to start a new line of text.
 - Use the [Object](#) button to insert information from another program, e.g. a sketch. Select the program to use, then use the other program to create the “object”. Close the other program to return to Data.
4. Use the [Save](#) button when you've finished typing an entry. This saves the information you've typed, and clears the dialog so that you can type another entry.
5. Use the [Close](#) button when you have finished adding your entries.

Looking at entries

Data has two views you can use to look at entries: The **Card view** shows the information for each entry as a single page. A list of entries is shown in the Card browser next to the page; the currently displayed entry is marked with a bullet. The **List view** shows entries in a list, one entry per line, like a telephone directory.

- Tap the [Cards](#) or the [List](#) button in the Toolbar to move to a view, or select the commands on the [View](#) menu to switch between the views.
- In the Card view, tap on an entry from the Card browser next to the page. You can also use the [Next](#) and [Prev](#) buttons or left and right arrow keys to move between entries.
- In the List view, use the up and down arrow keys to move through the list. You can use the scroll bars or the left and right arrow keys to see the other columns not currently shown.

Sorting entries

Entries are listed in the order you add them. To sort them into alphabetical order, select the [Sort by label](#) command from the [Tools](#) menu. You can sort by any label and can also set the number of the labels to sort by, if you wish to sort by more than one label.

For example, in a database where you keep lists of your CDs, you could sort using the 'Artist' label, or the 'Title'. Or, you may wish to sort using both labels, 'Artist', then 'Title'.

Note: See '*Customising the database*' for more about setting up a database with different labels.

Customising Data

To change the order of the labels in the Card view, and the columns in the List view, and change the way the labels are displayed:

1. Select the [Label preferences](#) (Cards view) or [Column preferences](#) (List view) command from the [Tools](#) menu.

2. Tap the label or column, or press the Spacebar to tick the label(s) or column(s) you wish to change, then use:

- the [Move up](#) or [Move down](#) buttons to move them to a new position with respect to the other labels or columns.
- the [Hide/Show](#) button to “hide” the label or column so that its information will not appear in the Card view or List view. You may wish to do this if the information is confidential and you do not wish the information to appear on screen in the Data views. Even if a label or column is hidden, you can still view and edit its information when you add or edit an entry.
- the [Font](#) button to change the font size or type, or apply other formatting to the text.

You can also use the [View preferences](#) command in the Card view or List view to control how each view looks.

Finding an entry

You can find a particular entry, or a number of entries, simply by typing the text or characters that you want to find into the 'Find:' box. You can do this in either view.

- Start typing some text that you know is included in the entry you wish to find. Press Enter to display all the entries that contain the text.

Note: The information next to every label is searched, so you can find an entry by typing text that is beside a “hidden” label.

You may prefer to limit the labels that are searched, to make finding entries quicker:

- Select the [Find by label](#) command from the [Tools](#) menu, and tick the label(s) you want to use for searching. Add or remove a tick by pressing the Spacebar or by tapping the label with the pen.

Changing or deleting entries

To change the contents of an entry:

1. Select the entry by displaying it in the Card view, or by highlighting the line for the entry in the List view.
2. Tap the [Edit entry](#) button or select the command from the [Edit](#) menu.
3. Change the information as required, and press the [Save](#) button to save your changes.

To delete an entry:

1. Select the entry as described above.
2. Select the [Delete entry](#) command from the [Edit](#) menu.

Note: If you delete an entry by mistake, you can undo the damage by selecting the [Undo delete](#) command from the [Edit](#) menu.

Customising the database

You can use Data to store many different types of information. All you need to do is create a new file then change the labels in the file.

You can change the text in any label, or add or remove labels. If you wish, you can set up a new set of labels so that you can use a Data file for information other than names and addresses.

Important: It is best to set up the labels you want before you start to type in your entries.

To change the labels:

1. Select the [Change labels](#) command from the [Tools](#) menu.
2. Select a label and use the [Delete](#) button to remove it, or use the [Edit](#) button to change the existing text.

Note: When you delete a label, the information associated with it will be lost.

Adding labels

Use the [Change labels](#) command from the [Tools](#) menu and the [Add](#) button to add labels to a database. You can add labels for different types of information, e.g. text, numbers, dates, Yes/No only, and specify the number of characters which can be typed for a text label.

When adding or editing a label, you can also use the [Options](#) button to control how the label information is handled by the Data program. For example, how many characters are used when sorting the entries.

Important: It is not possible to change the data type for a label or the number of characters length of a text field after the label has been set. It is best to plan the database and label types first.

Printing Data entries

You can print all your Data entries, the current card, or choose a set of entries to print by typing a search clue.

- Before you print, refer to the instructions in the 'Printing' document to select a printer.

To print Data entries:

1. Display the entries to print by typing a search clue that the entries you want to print will contain. If you want to print all the entries, press Esc to make sure that all the entries are included.
2. Tap the [Print](#) button on the Toolbar or use the [Printing](#) command on the [File](#) menu:

- Use the [Page setup](#) command to control the page size, margins, and add headers and footers. See the '*Printing*' document for more details.
- Use the [Print setup](#) command to specify how the entries will appear in the printed copy.
- Use the [Print preview](#) command to display pages showing how your printed copy will look.
- Use the [Print](#) command to print your entries.
