# Programming for netpad

## PROGRAMMING

You can create and use programs on your netpad using the built-in programming language, OPL. Complete details of the OPL command syntax is described in the OPL Programming Manual, available on the netpad CD ROM at [\OPL\SysDoc\Oindex.html](#).

### *Displaying on-line help*

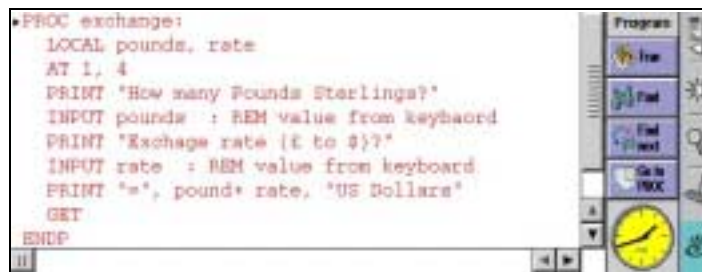

To display on-line help, select the [Help on Program](#) option from the [Tools](#) menu.

## Creating & running OPL programs

1. Create the program in the Program editor program.

Simply type in the OPL commands as required. You can edit text using the menu commands in the Program editor, which work in the same way as the commands in the Word processor, e.g. cut, copy, find.

Note: Text formatting will be applied to all the text in the file.

2. Tap the [Tran](#) button on the Toolbar or use the command on the [Tools](#) menu to translate the file into a program you can run on the netpad.

If an error is found during translation, the cursor is positioned at the point in the program where the error is found and an error message is displayed. Refer to the OPL programming manual for details of error messages.

The translated (executable) file will be given the same filename as the source file, but with the extension .OPO.

3. After the program has been translated without errors, you can run it.

To run the program from the System screen, highlight it and then tap on it, or press Enter.

## Programming options

Three languages are provided to allow you to program your netpad - OPL, C++, and Java.

- **OPL** is a BASIC-type language that can be edited and translated on the netpad. For more details on OPL, please refer to the OPL programming manual on the CD, or download the OPL32 SDK from the EPOCWorld website, [www.epocworld.com](http://www.epocworld.com).
- **C++** is the native language of the netpad, and allows the greatest access to operating system services. It is necessary to compile C++ programs on a PC - there is a Windows netpad emulator to allow development and debugging to take place on a single machine. The netpad C++ SDK may be downloaded from the EPOCWorld website, [www.epocworld.com](http://www.epocworld.com).
- **Java** is a platform-independent language developed by Sun Microsystems Inc. Programs written using Java technology may be run on a variety of computing platforms which have a Java Virtual Machine (JVM). The netpad Java SDK (including the netpad JVM) can be downloaded from the EPOCWorld website, [www.epocworld.com](http://www.epocworld.com).

For more information on programming netpad, please refer to the EPOCWorld website, [www.epocworld.com](http://www.epocworld.com).
