Introduction

Sheet is the spreadsheet program. It has many of the features and functions that you would expect from a fully featured spreadsheet.

You can use Sheet to create worksheets, and use PsiWin to transfer worksheets to and from your PC.

Displaying on-line help

To display on-line help, select the [Help on Sheet](#) option from the [Tools](#) menu in the Sheet view.

Sheet has two views:

- **Sheet view**, where information is displayed in cells on a worksheet. Cells are referred to by their position in the grid of columns and rows, e.g. D3. You can present information in table form in Sheet, and perform calculations based on sets of numbers stored in the worksheet.
- **Graph view**, where you can create graphs based on information stored in the worksheet.

Moving around

A dark border around a cell indicates the current cell. The information you enter in the input line applies to this cell.

- Tap any cell to select it, or use the arrow keys to move around. You can use the scrollbars or the arrow keys to move to other areas of the worksheet.
- Use the [Find](#) commands on the [Edit](#) menu to move to other cells. Use [Find](#) and [Find next](#) to move to cells if you know their content, or [Go to](#) to jump to a specific cell.

Note: You can alter the number of cells displayed by using the zoom commands, or by setting the zoom level using the command on the [View](#) menu.

Highlight more than one cell to perform actions that apply to an area:

- **To highlight more than one cell:** drag the pen from the first cell in the block to cover the desired cells.
- **To highlight a whole column or a whole row:** tap the shaded column or row heading, e.g. "C" or "2".
- **To highlight the entire worksheet:** tap the square in the top left corner of the worksheet headings.

Entering information

To enter information in a cell, select it and start typing. You will see the information you are entering on the input line. The first character you type tells Sheet what kind of information the cell will contain:

- **To enter numbers:** begin with a number or with one of these characters: . (full stop), - (minus), + (plus) and ((bracket).
- **To enter text:** simply type it in. If your text starts with a number, type a ' first, e.g. '24 Longton Road. If you want the text itself to contain a ' at the beginning, type two of them, e.g. "97 sales figures.
- **To enter a formula for a calculation:** begin with a =. For example, to make a given cell display the sum of the contents of cells B1 and B2, type in =B1+B2.
- **To edit the information in a cell:** simply highlight the cell and press Enter. You can then edit the contents on the input line.
- **To enter a date:** type the day, month and year on the input line, separating them with a space or the date separator character as set in the System screen, e.g. 1 Oct 69 or 1 10 69, or 10 1 69 if you use this date format.
- **To enter a time:** type the hour, minutes and seconds, separating them with a colon (or the time separator character as set in the System screen).

You can also change the width of columns and the height of rows, to suit the information contained in them.

To change column width and row height:

- Drag the right-hand edge of the column heading to adjust its width, and the lower edge of the row heading to adjust its height.
- Use the commands on the [Format](#) menu to set the height of a row in points and the width of a column in characters.

Note: If you enter more text than can be displayed in the current cell, the information will run over into the next column if that column is empty, so you may want to adjust the column width. If you enter a number that's too long for the cell, you will see a series of # signs in the cell, though the actual number will still be stored.

- **To freeze panes on the worksheet:** type the information you wish to "freeze" in the rows and columns, position the pointer in the cell below the row to freeze, and to the right of the column to freeze (this will often be B2). Tap the  button in the top Toolbar, or select the [Freeze panes](#) command from the [View](#) menu. The "frozen" panes will stay on screen when scrolling through the rest of the worksheet.
- **To protect the worksheet from changes:** select the [Protection](#) command from the [Tools](#) menu.
- **To allow changes to some cells only:** highlight the area for which you wish to allow changes, select the [Protection](#) command on the [Tools](#) menu and remove the tick to "unlock" the highlighted cells. If you then protect the worksheet, changes are only allowed to the cells that are not locked.

Performing calculations

There are two ways to perform calculations:

- **Type the calculation into a single cell.** When you press Enter or move to another cell, the result will be displayed on the worksheet.
- **Use a formula for a calculation;** just type the different parts of your calculation in separate cells and note their references, e.g. income in B2 and tax in C2. In a new cell, enter the formula, beginning with a =. Use the cell references for the components of the calculation rather than the numbers themselves. For example, =C2-(B2*C2). The value displayed in this cell is calculated for whatever values you use in the component cells.

Note: If you have a row or column of cells and want to know their sum, position the pointer in

the cell at the end of the row or column and tap the button in the top Toolbar. Sheet will insert the formula for the sum of the preceding group of cells and calculate the result.

There are two types of cell reference you can use in a formula:

- **Relative references**, such as A2. These get updated when copied and moved elsewhere. For example, a reference to cell A2 in a formula in cell B3 will change to B2 if the formula is copied to cell C3.
- **Absolute references**, such as \$A\$2. These contain a \$ sign in front of the parts of the reference that you don't want to change even if the formula is moved elsewhere. So, \$A\$2 in cell B3 remains \$A\$2 when copied to cell C3.
- You can combine the two types of reference: A\$5 in A6 will become B\$5 when copied to B8.

A formula that contains a reference to its own cell, either directly or indirectly, is called a "circular reference". You can find any circular references in the worksheet using the [Find](#) commands on the [Edit](#) menu. You should avoid making circular references as they produce unpredictable results.

Use = to enter formulae

Arial		10 pt	B	<i>I</i>	<u>U</u>													Expenses
B17		=SUM(C17:E17)																
	A	B	C	D	E	F	G											
1																		
2	Date	Description	Travel	Hotel	Entertainment													
3	01/07/99	Meeting in Manchester	32.50		27.00													
4	04/07/99	Paris Sales meeting	380.00	75.00	34.00													
5	15/07/99	Customer visit			120.00													
6	16/07/99	Customer visit			50.00													
7																		
8																		

Recalculation

Sheet automatically recalculates your worksheet every time you change part of a calculation. You may want to turn this feature off if you are making a large number of changes in the worksheet.

To turn recalculation off:

- Select the [Preferences](#) command from the [Tools](#) menu, and set Auto recalculation to off. When Auto recalculation is off, a '+?-' symbol will be displayed at the right end of the input line whenever you need to recalculate manually to update results.

To make Sheet recalculate the worksheet, select the command from the [Tools](#) menu.

Functions

Sheet has a large number of functions, e.g. mathematical, financial and trigonometric functions that you can incorporate in your calculations. See the built-in help on the netpad for a full list and details of syntax.

- **To use a function in a calculation:** just type it in.
Alternatively, tap the function button or select [Function](#) from the [Insert](#) menu. Choose the function you require.

Using ranges

A range is a rectangular block of cells. The reference for a range consists of the cell references of the top left and bottom right corners of the block, separated by a colon, e.g. B2:C6. You can use ranges to define areas of the worksheet for applying formatting, creating graphs, or include range references in formulae, e.g. =SUM(B2:C6).

- **To select a range:** highlight all the cells you want to be a part of your range.
- **To use a range in a formula:** highlight the range to be inserted while entering the formula. For example, type “=SUM(” then drag the highlight to cover the appropriate range, type a “)” and press Enter.

Naming ranges

- **To name a range:** highlight the range and add a name using the [Add name](#) command from the [Name](#) commands on the [Insert](#) menu. You can use this name in sums and formulae, e.g. “=AVERAGE(Bills)”. You can edit the range name using the [Edit name](#) command.

Changing how information is displayed

You can format the information in the worksheet in a number of ways, e.g. to differentiate the parts of tables and calculations. Formatting is applied to the currently selected cells.

- **To change the alignment of information:** tap  in the top Toolbar to set the horizontal alignment, or use the command on the [Format](#) menu to set both the horizontal and the vertical alignment.
- **To change the font:** use the buttons in the Top toolbar to change the font or font size. Alternatively, use the [Font](#) command on the [Format](#) menu to select the font, font size and other attributes, e.g. bold, superscript, strikethrough etc.
- **To add bold, italic or underline:** use the    buttons in the top Toolbar, or use the [Font](#) command as described above.
- **To add a border:** tap  in the top Toolbar or select the [Border](#) command from the [Format](#) menu and select a border style for the each side of cell.
- **To add shading:** tap  in the top Toolbar or select the [Shading](#) command on the [Format](#) menu, and select the shading you want to apply.

Sorting information

You can sort rows in a list based on values in a single column or in several columns. You can also sort columns based on values in rows, if your list is set up that way. In either case, you can sort using more than one row or column. For example, if you want to sort a table based on a ‘surname’ column, but have more than one entry for each surname, you can also sort again using a ‘first name’ column.

Sorting from top to bottom

You can sort information in order from highest to lowest value, or into alphabetical order, according to the information in a particular column. Use this type of sorting if you want to change the order of the rows in a table, e.g. to sort entries in a table into the order specified by an ‘Amount’ column.

To sort from top to bottom:

1. Highlight the range of information that you want to sort. Sheet will only sort information inside this range.
2. Tap the [Sort](#) button on the Toolbar and select [Top-to-bottom](#) or select the command from the [Tools](#) menu.
3. In the dialog, select the column that you want to use to order the rows, and specify the way that you want to sort. Click [Options](#) if you want to make the sort case sensitive.

Sorting from left to right

You can also sort from left to right. Use this type of sorting if you want to change the order of the columns in a table.

To sort from left to right:

1. Highlight the range of information that you want to sort, rows and columns. Sheet will only sort information inside this range.
2. Tap the **Sort** button on the Toolbar and select **Left-to-right** or select the command from the **Tools** menu.
3. In the dialog, select the row that you want to use to order the columns, and specify the way that you want to sort. Click **Options** if you want to make the sort case sensitive.

Changing the number format

Select the **Number** command from the **Format** menu to change the number format. You can set the formats for the current highlighted range or all cells in the worksheet.

The number formats include general, triad (e.g. 3 000 000) and scientific number display, as well as special formats for displaying text, currency, dates and times, percentages.

Note: Some settings for the way numbers are displayed, e.g. the thousands separator, are set in the System screen.

Arial		10 pt	B	I	U				+	Σ	f(x)	formats
E10		120345										
	A	B	C	D	E	F	G					
1		Formats										
2												
3												
4		Sample time formats		number formats								
5		2/14		General	145							
6		02/14/99		Fixed	145.00							
7		14 Feb 99		Scientific	1.45E+02							

Number formats

Graphs

You can use Sheet to create, format and print graphs based on information on the worksheet, for example to show annual sales figures, or the distribution of revenue.

You can create many types of graphs including line graphs, bar and column graphs, scatter charts and pie charts, and can add to or alter many aspects of the graph's appearance by tapping on the area of the graph you wish to change.

Creating a graph

To create a graph:

1. Enter your figures in the Sheet view. An example could be as follows:

	A	B	C	D	E	F
1		Jan	Feb	March	April	May
2	London	-2	-3	2	5	10
3	New York	-10	-10	1	6	1
4	Rome	2	4	5	7	15
5						
6		Mean Temperatures in Centigrade				
7						

- Highlight a column or row of numbers in the Sheet view (just the numbers). This will be the first 'range' that your graph depicts. You can add other ranges later on to build up your graph.
- Tap the **Graph** button on the Toolbar to move to the graph view. You will see your graph displayed on the screen.
- Add each row or column in turn.

Changing views

Use the Sheet and Graph buttons on the Toolbar to switch between the two views.

- Add titles as discussed below.

Replacing the graph range

When you create a graph, it is set to the range you first specified. It will reflect changes to the data within that range, but will not reflect other ranges you highlight on the worksheet. To replace the current graph range (or ranges) with a new one:

- In the Sheet view, highlight the new range you want the graph to use.
- Switch to the Graph view, then press the **Set ranges** button in the top Toolbar. The new range(s) will replace the old one(s) as the subject of the graph.

Adding a range to a graph

You can add further ranges to graphs to display additional information, e.g. to include a previous year's sales figures as well as the current ones.

- To add a range to a graph:** select the range you want to add to your graph in the Sheet view, switch to the Graph view and then select the **Add selected range** command from the **Ranges** menu.

Graph type & appearance

When you first create a graph, it will be a column graph. Change the type using the button in the top Toolbar, or the [Graph settings](#) command. The graphs types include line graphs, bar and column graphs, scatter graphs and pie charts.

- **To change the graph from 2D to 3D and back:** use the [3D](#) button on the Top toolbar, or the [Graph settings](#) command.
- **To change the pattern used for a range:** select the [Change range](#) command from the [Ranges](#) menu, and then choose the range and the fill colours and styles for each range.
- **To change the background, text and line colours of a graph:** use the Colours and Styles pages in the Graph settings and Change range dialogs.

Note: You can alter many aspects of the graph appearance by tapping on the area of the graph you wish to change.

Adding titles, labels and grid lines

- **To add a title to a graph:** select the [Graph settings](#) command from the [Graphs](#) menu and insert the title. You can change the style and font of the title using the [Title font](#) command on the [Graphs](#) menu or by tapping on the [Title Font](#) button.
- To add axis titles: use the [Format X-axis](#) and [Format Y-axis](#) commands. You can also use these commands to format the X and Y axes, e.g. to add grid lines, tick marks, add or remove axis labels, alter the axis position and scale, or hide them completely. You can change the style and font of the axis title using the [Axes font](#) command on the [Axes](#) menu.
- **To add labels to each range:** use the [Change range](#) command to specify the type of label you want and the cells in which your labels are stored.
- **To add a legend to a graph:** tap the [Legends](#) button on the top Toolbar and select the desired position for the legend. Alternatively, use the [Graph settings](#) command.

Working with more than one graph

You can create more than one graph for a worksheet and switch between them easily.

- **To create a new graph:** highlight the first range for the new graph, and then switch to the Graph view. Select the [New graph](#) command from the [Graphs](#) menu, and specify the settings for the new graph.
- **To switch between the graphs you have created:** tap the [Graph](#) button on the top Toolbar or use the command on the [Graphs](#) menu.

Printing from Sheet

You can print a range of pages, the entire worksheet or a graph from Sheet using the [Printing](#) commands on the [File](#) menu. You need to set up the page layout and printer first, using the [Page setup](#) and [Print setup](#) commands. You can use the [Print preview](#) command or the [Print](#) button in the Toolbar to display a preview.

See the '[Printing](#)' document for more details.
