Introduction

You can use Sketch to produce pictures, including maps, freehand sketches, invitations etc. You can start straight away, by drawing freehand with the pen on the screen. However, you may want to change the “pen” or “paper” before you begin to draw.

You can select:

- The “tool” to draw with. Each type of line or shape you can draw has a tool that you can select. When you start Sketch the Freehand drawing tool  is selected.
- The colour of the tool. The default drawing colour is black. To change the shade, tap on a colour in the Toolbar, or select the [Colour tools](#) on the [Palette tools cascade](#) from the [Tools](#) menu. Then select a colour.
- The width of the line for the drawing tools and the erase tool. To change the width, tap on a width in the tool bar, or select the [Width tool](#) on the [Palette tools](#) cascade from the [Tools](#) menu.
- The size of the sketch or the area on which you can draw. When you first start this is set to the same size as the screen. If you want to make it larger, select the [Resize sketch](#) command from the [Tools](#) menu and type in the new size. If the sketch is larger than the screen, you can use the scroll bars to move around the screen.

Displaying on-line help

To display on-line help, select the [Help on Sketch](#) option from the [Tools](#) menu.

What are pixels?

You can specify some settings used in Sketch in “pixels”, e.g. the pen width. Pixels are dots on the page, which are combined to make up a picture. For example, when you draw a line on the page, Sketch treats it as a number of coloured pixels grouped together to form a line. If you later want to change the line, you have to edit each pixel.

Drawing sketches

- Tap on a button in the Toolbar to select a different drawing tool, or select a drawing tool from the [Tools](#) menu.
- Change the pen colour and width before starting to draw.
- Use the pen to draw.
- **To draw a straight line:** tap , or select the [Line](#) command on the [Drawing tools](#) cascade from the [Tools](#) menu.
- **To draw either hollow or filled circles and ellipses:** tap  or , or select the [Oval](#) or [Filled oval](#) drawing tools on the [Drawing tools](#) cascade from the [Tools](#) menu.

- **To draw either hollow or coloured squares and rectangles:** tap  or , or select either the [Rectangle](#) or [Filled rectangle](#) drawing tools on the [Drawing tools](#) cascade from the [Tools](#) menu.
- **To draw in a similar style to using a can of spray paint:** tap  or select the [Spray](#) drawing tool on the [Drawing tools](#) cascade from the [Tools](#) menu.

Showing the cursor position

You can use the commands on the View menu to view the cursor position as cross hairs, or as a message in the top right-hand corner showing the number of pixels across (the X co-ordinate) and down (the Y co-ordinate).

Changing a sketch

You can change a sketch in two ways:

- by selecting an area and changing the selected area, e.g. moving, rotating, flipping or resizing it.
- by editing the pixels which make up the sketch.

To view the sketch in more detail, select the [Zoom in](#) command on the [View](#) menu. When you zoom in on a picture you can see the pixels comprising the picture and edit them individually.

Zoom in to view pixels

Selecting & moving objects

- **To select part of the picture:** tap , or select the [Select area](#) command from the [Drawing tools](#) cascade on the [Tools](#) menu, then use the pen or arrow keys to drag a box over the area.
- **To select the whole picture:** select the [Select all](#) command from the [Edit](#) menu.
- **To resize an area:** select an area, then use the pen to drag one of the “handles” surrounding the area to a new position to enlarge or reduce the area. Use a handle at a corner to resize both the horizontal and vertical dimensions keeping the same proportions; the handle from the midpoint of a horizontal “edge” to resize only the vertical dimension, and the handle from the midpoint of a vertical edge to resize only the horizontal dimension.
- **To move an area:** select an area, then tap inside the selected area with the pen and drag the area to the new position. Tap elsewhere to fix the selected area to the sketch.

You can turn selected areas over, and turn them round at angles of 90 degrees.

- **To flip part of a sketch:** select the area and then select either the [Flip horizontally](#) or [Flip vertically](#) command from the [Transform](#) menu.
- **To rotate part of a sketch:** select the area and then select the [Rotate](#) command from the [Transform](#) menu.

Transparency

When you move a selected area you can “overlay” it on top of an existing area of the sketch. You can specify whether the existing sketch shows through by making areas “transparent”.

- **To make a selected area transparent**, either press the  button in the Toolbar, or ensure that the [Make transparent](#) command on the [Transform](#) menu is ticked.
- **To make the selected area opaque** (so that any underlying sketch does not show through), either press the  button in the Toolbar or remove the tick from the [Make transparent](#) command on the [Transform](#) menu.

Erasing & undoing

You can delete either all or part of your sketch, or undo up to the previous five actions you performed:

- **To delete part of your sketch**: tap  or select the [Erase](#) drawing tool on the [Drawing tools](#) cascade from the [Tools](#) menu. Use the pen to delete part of the picture, starting from the cursor position.
- **To change the width of the Erase tool**: tap on a width in the Toolbar, or select the [Width tool](#) on the [Palette tools](#) cascade from the [Tools](#) menu. Change the width as required.
- **To delete the whole sketch**: select the [Delete all](#) command from the [Edit](#) menu.
- Tap  or select the [Undo](#) command from the [Edit](#) menu to remove the last action performed.

Changing colours

You can change the colour of an area by selecting a different colour and using the Freehand drawing tool to draw over the existing colour. You can select the [Zoom in](#) command from the [View](#) menu to view the picture in more detail, and change the colour of the individual pixels. Use the [Reverse colour](#) command from the [Transform](#) menu to invert the colour of a selected area. For example, reversing the colour of an area makes any black areas white and vice versa.

Cutting out, cropping & re-sizing

You can cut out part of a picture by selecting the area to remove and selecting the [Cut](#) command from the [Edit](#) menu.

To remove unused space from around the edges of a sketch, select the [Crop](#) command from the [Tools](#) menu.

Adding text

To add text to your picture:

1. Tap  or select the [Insert text](#) command from the [Tools](#) menu.
2. Type the text in the Insert Text dialog. You can format the text *before you insert it* using   or  and use the [Font](#) button to set the font type, size, colour and printing position (Normal, Subscript or Superscript) of the text.
3. Press the [Insert](#) button to add the text to your picture.
4. The text is selected when you insert it into the sketch. You can move or resize it as usual.
5. Tap elsewhere on the screen to fix the text onto the sketch.

Inserting “clipart”

Sketch includes a gallery of “clipart” pictures, which you can insert into a drawing:

1. Tap  or select the **Clipart** command from the **Tools** menu. The clipart palette is displayed.
2. To select a piece of clipart, either tap the picture, or use the arrow keys to select a picture and press Enter. You can rotate the clipart, for example, if you draw an arrow , then flip it vertically you get . Rotating  once provides .
3. The clipart is selected when you insert it into the sketch. You can move or resize it as usual.
4. Tap elsewhere on the screen to fix the picture onto the sketch.

Printing sketches

The Printing commands are on the **File** menu.

- Before printing, it is useful to see what the sketch will look like on the page. To preview your picture use the **Print preview** command.
- To change the page size, orientation and margins, or add headers and footers to a sketch, use the **Page setup** command.
- When you are ready to print the picture, select the **Print** command.

Sketch files

When you use Sketch for the first time, you will see a blank screen. When you run Sketch at other times, the last sketch you created is automatically opened so that you can continue working.

- **To start a new sketch file:** use the **Create new file** command on the **File** menu.
- **To return to a different sketch file:** open the file using the **Open file** command on the **File** menu.

The current file is saved each time you exit Sketch. You can also use the **More** commands on the **File** menu to:

- save the file at any other time using the **Save** command, or give it a different name using the **Save as** command.
- reject all changes made to a file since it was last saved using the **Revert to saved** command.

Creating “wallpaper”.

You can change the “wallpaper” that appears in the background on the System screen. You can use any picture that you draw or import into Sketch. See the ‘*Customising your netpad*’ document for more information.
